Contrapoint for Contradiction (Drone/Ison)

Technical sheet — Polina Zinziver (they/them), Barcelona · SAT Research-Creation Residency 2027–28 · draft to the best of current knowledge

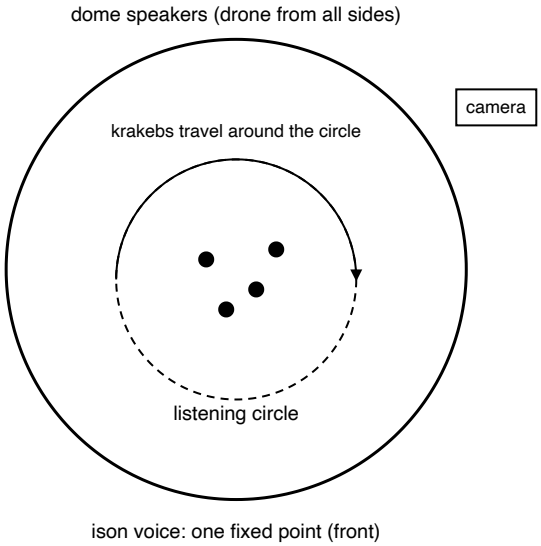

Playing space

The Satosphere dome, floor clear. Listeners stand or move freely in a circle under the dome; no seating. A marked circle on the floor (tape or light), diameter to be set with the SAT team (approx. 6–10 m).

Hanging needs

One or two cameras mounted overhead / at the dome edge, looking at the floor circle, for LivePose. No other hanging.

Plan

Signal chain

Camera → LivePose (people count, density, shared sway) → OSC → ossia score / SuperCollider (drone pitch, pulse tempo, krakebs path) → SpatGRIS → Satosphere speaker system. Rule: more people in the circle → lower drone, faster pulse.

Equipment I bring

Laptop with SuperCollider patch; studio headphones (binaural reference version).

Equipment requested from the SAT

- Satosphere multichannel system and access for spatial tests
- 1–2 cameras + computer for LivePose
- Audio interface / network audio link to the dome system
- Optional: a few small speakers for a portable test of the circle

Existing material

Headphone demo + web console: zinziverpolina.github.io/portfolio/sarv.html · Portfolio: zinziverpolina.github.io/portfolio/

Availability

Online introductory workshop January 2027: [to confirm]. In Montréal: two months from February 2027, dates to agree with the SAT.
